

# Who is the mystery patient?

## UNDER THE MASK

### Ms. Radhika

With chronic kidney disease (eGFR < 45)

Sex and age	Female, 50 years old	
T2D	T2D for 5 years	
Relevant history	<ul style="list-style-type: none"> <li>Hypertension (controlled)</li> <li>Dyslipidemia (controlled)</li> <li>Non-smoker</li> </ul>	
Recent exams	BP	128/80 mmHg
	BMI	30 kg/m <sup>2</sup>
	A1C	6.9%
	eGFR	43 mL/min/1.73 m <sup>2</sup>
	uACR	25 mg/mmol

#### Medications

Metformin 1000 mg BID  
Glyclazide 160 mg BID  
Sitagliptin 50 mg DIE  
Perindopril 4 mg DIE  
Simvastatin 20 mg DIE

#### Other relevant information

No additional information

- With obesity
- With CVD and controlled A1C
- Experiencing fatigue and shortness of breath on exertion
- With chronic kidney disease (eGFR < 45)
- With heart failure
- With CV risk factors and A1C > target values
- Independent patient aged 80 or older, with multiple comorbidities
- Newly diagnosed with T2D

Questions	Key Learnings
1. What do you think of the patient's eGFR (43 mL/min/1.73m <sup>2</sup> ) and uACR (25 mg/mmol)? What therapeutic changes would you make based on these parameters?	<ul style="list-style-type: none"> <li>Importance of eGFR and uACR in relation to the albuminuria prevention/treatment strategy</li> <li>Influence of eGFR on treatment regimen and guideline recommendations</li> </ul>
2. How often do you perform kidney function testing (eGFR and uACR)? <ul style="list-style-type: none"> <li>- How would you rate her risk of developing kidney disease?</li> <li>- When to refer the patient to a nephrologist.</li> </ul>	<ul style="list-style-type: none"> <li>The Diabetes Canada guidelines recommend that screening for diabetes-related kidney disease (eGFR and uACR) in adults with diabetes be performed annually if the patient is stable and non-diabetic kidney disease or acute kidney disease are not suspected.</li> <li>According to the KDIGO criteria, this patient is at very high risk of developing nephropathy.</li> </ul>
3. Do her kidney function results preclude the use of an agent for cardiorenal protection?	<ul style="list-style-type: none"> <li>The cardiorenal protective effect is independent of kidney function</li> </ul>
4. And if the patient's eGFR were to drop to 28 mL/min, what would you do with an SGLT2 inhibitor, if anything?	<ul style="list-style-type: none"> <li>Safety and effectiveness of SGLT2 inhibitors on low eGFR</li> </ul>
5. Could we maintain a GLP-1 RA if the eGFR drops to 25 mL/min?	<ul style="list-style-type: none"> <li>Safety and effectiveness of GLP-1 RAs on low eGFR</li> </ul>
6. What is the evidence to support the use of an SGLT2 inhibitor in this patient? Finerenone? What if the patient were non-albuminuric?	<ul style="list-style-type: none"> <li>Evidence for SGLT-2 inhibitors in CKD Patients</li> </ul>
7. If the patient had CKD, but not T2D, would you still use an SGLT2 inhibitor?	<ul style="list-style-type: none"> <li>The efficacy of SGLT2 inhibitors in non-T2D patients with CKD</li> </ul>

**A1C:** glycosylated hemoglobin; **BID:** twice daily; **BMI:** body mass index; **BP:** blood pressure; **CV:** cardiovascular; **DIE:** once daily; **eGFR:** estimated glomerular filtration rate; **T2D:** type 2 diabetes; **uACR:** urine albumin-to-creatinine ratio.
